Evaluation of Chlamydia Screening in different clinical locations in Lambeth, London, UK.
Sebastian Kalwij, MD MSc¹, Meroe Bleasdille BSc MSc²
(1)Primary Care Lead Chlamydia Screening Lambeth, London, UK. (2)Chlamydia Screening Coordinator Lambeth, London, UK

LEARNING OBJECTIVES
By the end of the presentation participants will be able to discuss the contribution different screening venues for Chlamydia Screening can make.

BACKGROUND
Screening for Chlamydia has moved increasingly from secondary care to primary care. Different clinical facilities have been offering Chlamydia Screening.

OBJECTIVES
To demonstrate that screening for Chlamydia in the community is feasible and to identify which facility has the most impact.

METHODS
In June 2009 Chlamydia Screening in Lambeth, England, UK was in its fourth year. In order to provide choice for patients, different clinical set ups have been offered. We looked back at all screens performed in Lambeth between 2005 and 2009. We used lab reports from the two main hospitals (Kings College Hospital and St Thomas' Hospital). We excluded screens offered in Secondary care setting like Genito-urinary clinics

RESULTS

CONCLUSIONS
A wide variety of screening venues were involved in offering screening for Chlamydia. The largest volume of screens (49%) came from Primary Care Practices. This may prove that Primary Care Practitioners are important players in offering Chlamydia Screening opportunistically to young people.

FUTURE
In order for Chlamydia Screening to be successful and sustainable in the future, involvement of General Practice is important.
